UXUI involvement

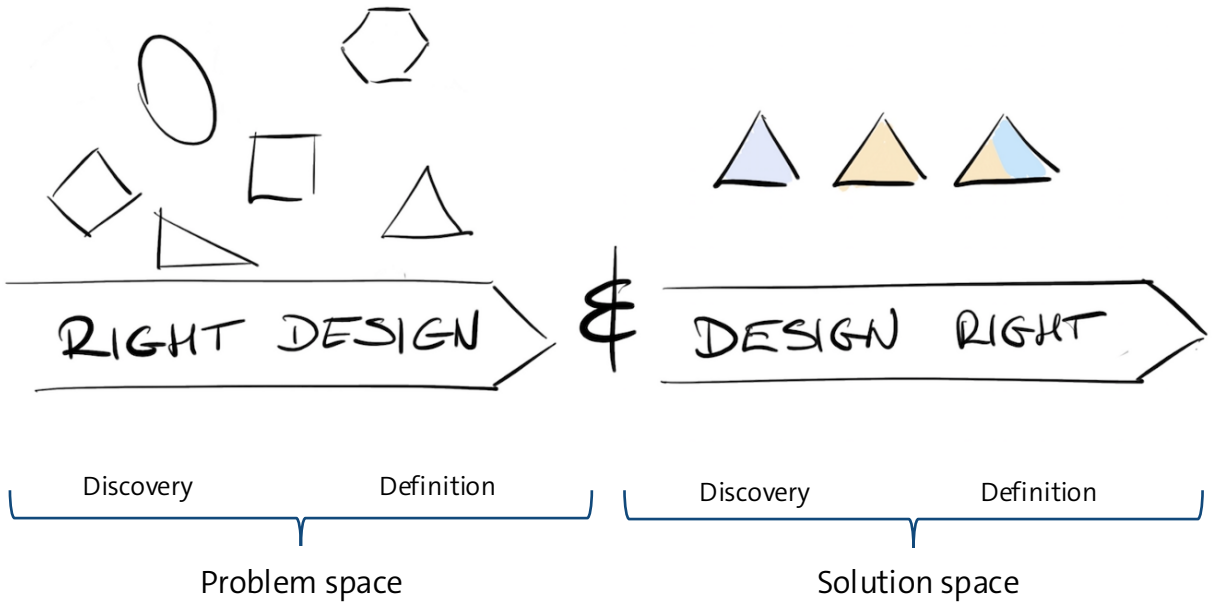
UXUI Design Platform // SOIV

GRUNDFOS

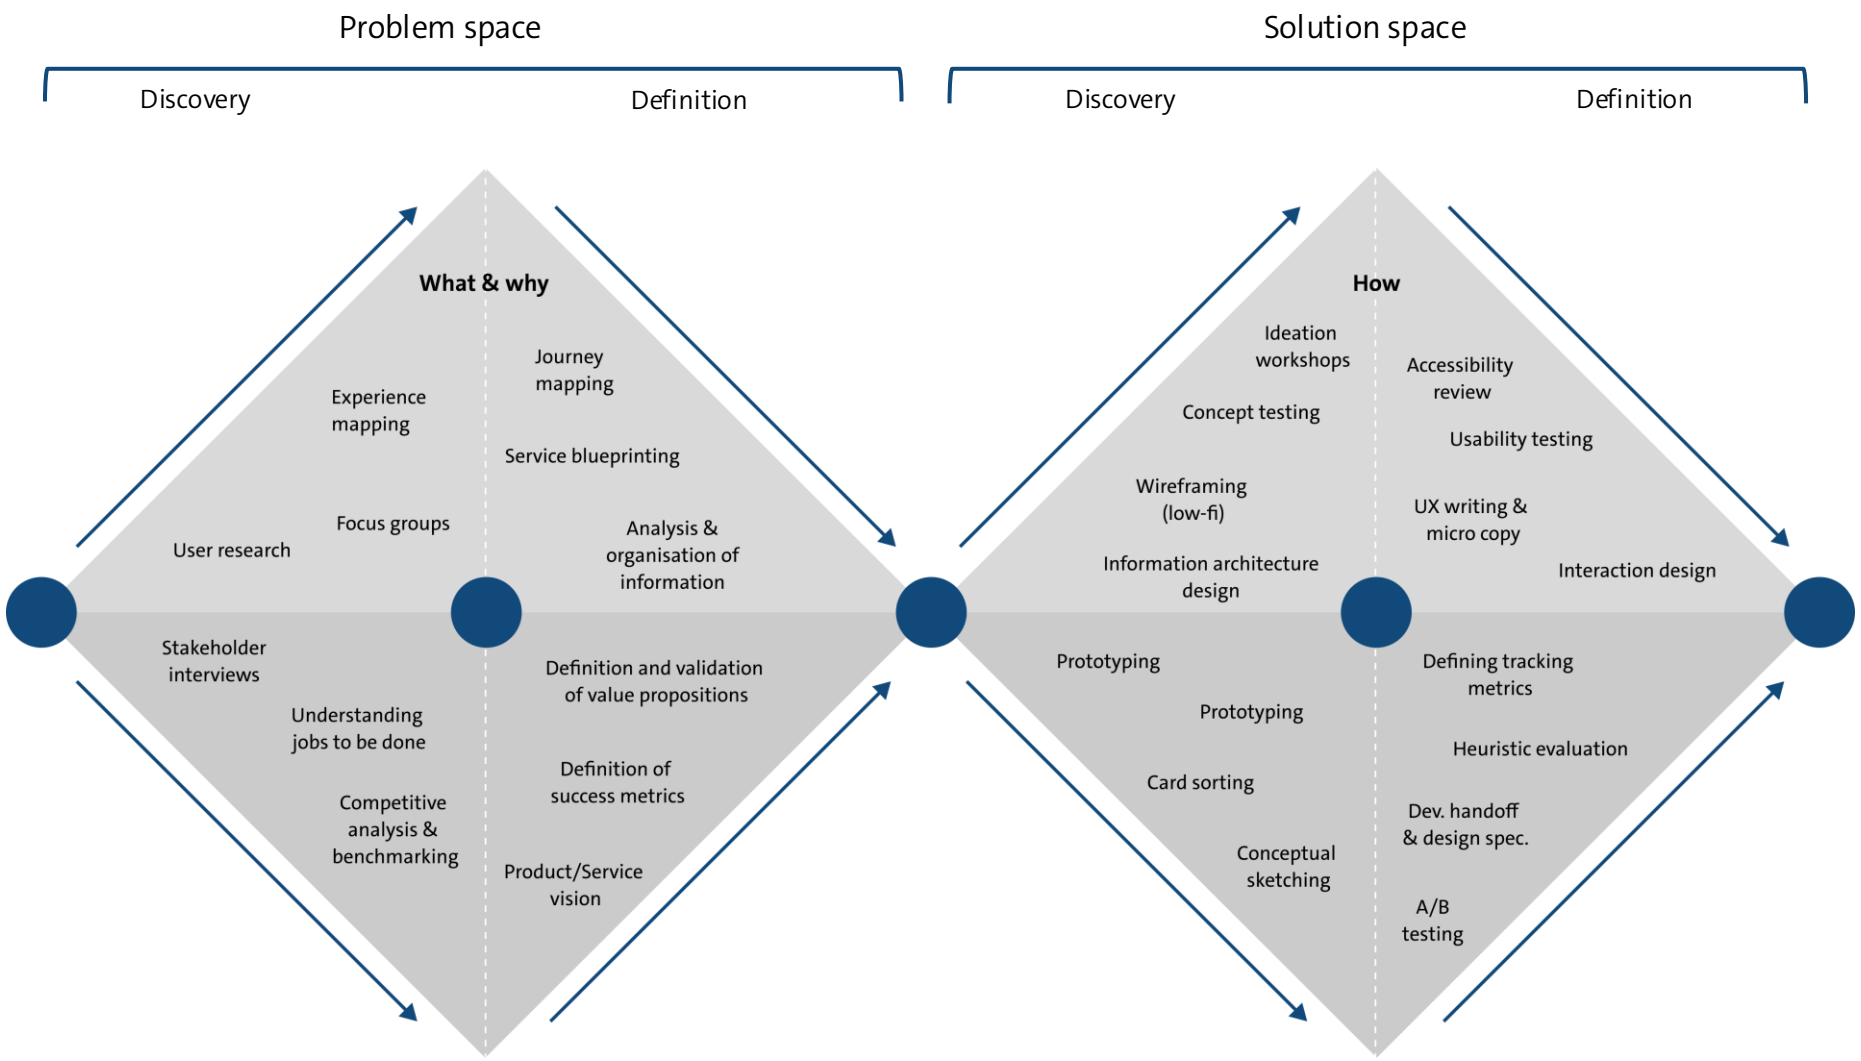
Possibility in every drop

UXUI involvement

- Problem space & Solution space
- Involved in getting the "Design right" is too late
- Earlier involvement enables faster failures at a much lower cost
- Help define the **Right design** with end-user insights and perspectives
- Define metrics for success for later validation with end-users
- Working with product/business in problem space and development in solution space.



Design process



GRP STRATEGY SETTING	OPPORTUNITY SCOPING	PORTFOLIO MNGM	EXECUTION (Concept)	EXECUTION (Developm.)	COMMERCIALISING
Contribution Design provides evidence-based customer and experience insight to inform future strategic directions. Design does not define strategy; it contributes the human lens.	**Contribution** Design brings deep problem understanding, customer needs validation, and early visualisation of solution directions to help the team decide whether an opportunity is real and attractive.	**Contribution** Design provides evidence on desirability and experience feasibility, so portfolio decisions are made with a clear understanding of customer value and adoption risk.	**Contribution** Design ensures the chosen concept solves the validated problem, reflects actual customer needs, and is clear enough for the organisation to commit to development.	**Contribution** Design ensures the product's experience is coherent, buildable, and ready for implementation.	**Contribution** Design ensures customer experience is monitored, understood, and improved after launch.
Activities • Scan for customer-relevant trends and behavioral shifts • Provide insight into emerging needs and frictions • Visualise possible future customer experiences (to make strategy tangible) • Help clarify where new value could be created for future customers	**Activities** • Conduct foundational research to understand context, needs, behaviours • Validate whether the problem is real, important, and worth solving • Map current-state journeys • Facilitate co-creation to explore early solution possibilities • Make early solution ideas tangible (sketches, low-fi prototypes) so teams can discuss, compare, and challenge them	**Activities** • Compare opportunities based on customer desirability and problem severity • Highlight customer-facing risks (adoption, usability, clarity of value) • Clarify what differentiates one opportunity from another in real customer terms • Translate insights into customer-value arguments for portfolio discussions • be created for future customers	**Activities** • Create future-state journeys and conceptual flows • Build mid-fidelity prototypes to explore how the solution works • Validate: Usability assumptions, clarity of value for the user, adoption barriers • Translate insights into experience requirements (not technical requirements) • Align cross-functional stakeholders on the intended experience	**Activities** • Detailed interaction design (flows, states, logic) • High-fidelity UI design aligned with the design system • Edge-case and error-state definition • Usability testing of designs throughout development • Final handoff of design specifications • Support developers with clarifications during implementation	**Activities** • Analyse real-world usage and behaviour • Conduct post-launch evaluations (qualitative + analytics) • Identify friction points and improvement opportunities • Support creation of improved flows, variants, or refinements • Ensure learnings feed back into future opportunities
Outputs • Insight summaries on customer/market changes • Experience-driven opportunity theme • Visual artefacts illustrating strategic possibilities	**Outputs** • Validated problem statement • Prioritised customer needs • Current-state journey and friction points • Co-created early solution directions (visualised options, not final concepts) • Customer-experience risks and assumptions to be tested later	**Outputs** • Customer-desirability comparison across opportunities • Customer-facing risk contributions (not technical/business risk) • Clear articulation of how each opportunity would deliver customer value	**Outputs** • Future-state journey • Mid-fi prototypes showing how core value will be delivered • Prioritised experience requirements • Identified usability/adoption risks • Clear narrative of the solution experience	**Outputs** • Finalised UX flows • High-fi UI screens • Design specifications and documentation • Usability test reports • Accessibility and design-system compliance checks	**Outputs** • Post-launch experience insights • Recommendations for enhancements • Updated UI/UX elements • Behavioural kpis and experience metrics
Decisions "Which customer problems or emerging needs are strategically important?" "Where should we explore further in Opportunity Scoping?"	**Decisions** "Is this problem worth addressing?" "Who exactly has this problem and why?" "Which early solution directions look promising enough to investigate further?" "What customer-related risks must we address before Execution?"	**Decisions** "Which opportunities have the strongest evidence of customer desirability?" "Which opportunities carry customer/adoption risks we must address before investment?" "Where should we prioritise based on validated user needs?"	**Decisions** "Does this concept solve the validated problem in a usable and meaningful way?" "Do we understand the experience sufficiently to begin detailed design and development?" "What experience elements are non-negotiable for user value?"	**Decisions** "Is the experience ready for implementation?" "Are there usability issues that must be fixed before release candidate builds?" "Does the final solution meet the experience requirements defined earlier?"	**Decisions** "What should we improve based on real user behaviour?" "Where are customers struggling or failing to adopt?" "What learnings should inform the next iteration or the next generation?"
